Proc. Natl. Acad. Sci. U.S. A. 99:16899-16903 (2002).
-!- FORCATION: Binds specifically to peptidoglycan and is involved in innate immunity. Function in intracellular killing of bacteria. The soluble form triggers apoptosis in vitro.
-!- SUBCELLULAR LOCATION: Exists in both soluble and membrane-

SUBUNIT: Efficient DNA binding requires dimerization with another
bHLH protein. Forms homo- or hetero-oligomers with myogenin, El2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SUBCELLULAR LOCATION: Nuclear. TISSUE SPECIFICITY: Expressed in several tissues and cell types including skeletal muscle, thymus, and a B-cell line. SIMILARITY: Contains I basic helix-loop-helix (bHLH) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        01-0CT-1996 (Rel. 34, Created)

The invention relates to human and murine peptidoglycan recognition protein-related liver proteins (PGRP-L) and nucleic acid molecules cancoding them. The polypeptides of the invention can be used as food additive or preservative to increase or decrease storage capabilities. The PGRP-L polymucleotides are used for chromosome identification. They care also useful as probes for diagnosing disorders related to the female reproductive system, particularly breast and ovary cancer. They are also useful in the gene therapy of breast and ovarian cancer. The PGRP-L custul in the gene therapy of breast and ovarian cancer. The PGRP-L cancer particularly breast and ovarian cancer. The PGRP-L antagonists are useful in the diagnosis, treatment and prevention of cancer particularly breast and ovarian cancer, and cancers of the adrenal cancer particularly breast and ovarian cancer, and cancers of the adrenal cancer particularly breast and ovarian cancer, and cancers of the adrenal disorders such as Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, cardiovascular disorders such as myocardial ischaemias; wound healing; neurological diseases such as Alzahimer's disease, cerebral anoxia and epilepsy, and infections diseases such as Alzahimer's disease, cerebral anoxia and parasitic infections the protein as viral, bacterial, fungal and recognition protein-related liver protein (hPGRP-L). This protein has recognition protein-related liver protein (hPGRP-L). This protein has isolated nucleic acids encoding human and murine peptidoglycan recognition protein-related liver (PGRP-L) proteins, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, and hyperproliferative disorders. 120 GHRÓLVRÍDCÞGDALFDLLRÍWPHFTAVSLRSLHÝTARRÞSVYTSSÍRÞLÞPACNSCARÍ 120 9 09 61 GHROLVRIDCPGDALFDLLRIWPHFTAVSLRSLHYTARRPSVYTSSTRPLPPACNSCART RGWHWVGAHTLGHNSRGFGVAIVGNYTAALPTEAALRTVRDTLPSCAVRAGLLRPDYALL 1 RGWHWYGAHTLGHNSRGFGVAIVGNYTAALPTEAALRIVRDTLPSCAVRAGLLRPDYALL Gaps 121 ASARPPISRRHVYSGNLGPAFAGHSAGNIPDPVTSAYAASAQPQTQPACPFPSS 174 121 ASARPPTSRRHVYSGNLGPAFAGHSAGNIPDPVTSAYAASAQPQTQPACPFPSS 174 161. .167 /note= "Antigenic region of human peptidoglycan recognition protein-related liver protein" 172. .174 /note= "Antigenic region of human peptidoglycan recognition protein-related liver protein" ; 0 human peptidoglycan liver protein" Length 174; Indels 100.0%; Score 174; DB 4; L 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides polypeptides (AAG65886-65918) which may be peptide hormones (including insulin, growth hormones, chemokines, cytokines, neuropeptides, integrins, Kallikreins, lamins, melanins, natrniretic hormones, neuropeptides, integrins, lamins, melanins, prostaglandins, secretogranins, selectins, thromboglobulins, thymosins) identified by high throughput genome-based biology and polymolectides (AAIG7176-67208) encoding them. The polypeptides can be expressed by standard recombinant methodology. The polypeptides are useful in the treatment of disease such as diabetes, breast-, prostate-, colon cancer and other malignant tumors, hyper- and hypotension, obesity, bulinia, anorexia, growth abnormalities, asthma, manic depression, dementia, delirium, mental retardation, Huntington's disease, Tourette's syndrome, schizophrenia, growth, mental or sexual development disorders, and dysfunctions of the blood cascade
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated polypeptides, which may be peptide hormones, which are identified by high throughput genome-based biology which identifies genes and gene products as therapeutic targets for treatment of diseases such as diabetes and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          system including those leading to stroke. The polymucleotides may be used as diagnostic reagents through detecting mutations in the associated gene and for chromosome localization and for tissue expression studies. The polypeptides and polymucleotides may also be used as vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to novel human secretory or membrane processins (ADAS4072-ADAS5710) and their coding sequences (ADAS2433-ADAS4071). The coding sequences are useful in the gene therapy of diseases caused by abnormalize of the proteins, e.g. cancer, inflammatory diseases, osceoporosis or neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gene Therapy, human, secretory protein, membrane proteins, cancer, inflammatory disease, osteoporosis, neurological disease.

(SAGA) (PROT-)

Novel human proteins having hydrophobic domains useful for treating osteoporosis, Alzheimer's disease, Parkinson's disease, asthma, multiple sclerosis, rheumatoid arthritis, cancer, anemia, and stroke. Claim 1; Page 211-212; 351pp; English.

This sequence represents a human protein of the invention, which has hydrophobic domains. The DNA sequences can be used as a probe or as a genetic marker. The protein can also be used as a marker, and to identify potential genetic disorders. The DNA and protein can also be used as nutritional sources or supplements. The protein exhibits cytokine, cell proliferation, cell differentiation activities and induces production of other cytokines in certain cell populations. The protein also exhibits contain singularing or immune suppressing activity. It can be used in the other cytokines in certain cell populations. The protein also exhibits infections immune deficiencies and disorders, and to treat infections. The protein is also used for treathing auchimmume disorders infections used in also useful in the treatment of allergic reactions and conditions such as asthma, and in immune suppression after organ conditions such as asthma, and in immune suppression after organ and consequently in the treatment of mapping growth or regeneration. The protein is also used in the treatment of osteoprossis or osteoarthritis and in the treatment of periodontal disease and other contractions such as Alzheimer's disease, Parkinson's disease, and threatment of lung or liver fibrosis, reperfusion injury in various creamment of lung or liver fibrosis, reperfusion injury in various treatment of lung or liver fibrosis, reperfusion injury in various creament of lung or liver fibrosis, reperfusion injury in various creament of lung or liver fibrosis, reperfusion injury in various creament of lung or liver fibrosis, reperfusion and treatment of lung or liver fibrosis, reperfusion injury in various creament of lung or liver fibrosis, reperfusion injury in various creamment of lung or liver fibrosis, reperfusion injury in various creamment of lung or liver fibrosis, reperfusion injury in various also used for promoting or inhibiting tissue differentiation. They are

The invention provides polypeptides (AAGG5886-65918) which may be peptide hormones (including insulin, growth hormones, chemokines, cytokines, neuropeptides, integrins, kallikreins, lamins, melanins, natruiretic hormones, neuropepsin, pituitary hormones, pleiotrophins, prostaglandins, secretogranins, selectins, thromboglobulins, thymosins) identified by high throughput genome-based biology and polynucleotides (AAI67176-67208)

```
ô
               activities and as a fertility inducing therapeutic. They are used for treating various coagulation disorders and in treatment and prevention of conditions resulting from coagulation activities e.g. myocardial infarction or stroke. They also acts as receptors, receptor ligands or inhibitors or agonists of receptor/ligand interactions. They are used to treat inflammatory conditions such as septic shock, sepsis, ischaemia reperfusion injury, arthritis, and nephritis. They can be used to prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated polypeptides, which may be peptide hormones, which are identified by high throughput genome-based biology which identifies genes and gene products as therapeutic targets for treatment of diseases such

encoding them. The polypeptides can be expressed by standard recombinant methodology. The polypeptides are useful in the treatment of disease such as diabetes, breast-, prostate-, colon cancer and other malignant tumors, hyper- and hypotension, obesity, bulimia, anorexia, growth abnormalities, asthma, manic depression, dementia, delirium, mental retardation, Huntington's disease, Tourette's syndrome, schizophrenia, growth, mental or sexual development disorders, and dysfunctions of the blood cascade system including those leading to stroke. The polynucleotides may be used as diagnostic reagents through detecting mutations in the associated gene and for chromosome localization and for tissue expression studies. The

The present sequence represents a lipid-associated molecule (LIPAM).

LIPAM polypeptides polynucleotides and agonists are useful for treating a condition associated with decreased expression of functional LIPAM. The anti-LIPAM antibody is useful for diagnosing a condition or disease associated with the expression of diagnosing a condition or disease associated with the expression of LIPAM. The polypeptides, polynucleotides, agonists and antagonists may also be used for preventing these diseases. These polypeptides, conjustes and antagonists and antagonists and antagonists or classification or diseases. These polypeptides, treating or preventing cardiovascular (e.g. atherosclerosis, hypertension, aneurysms, congestive heart failure, angina pectoris, or classociation or aneurysms, congestive heart failure, angina pectoris, or bronchitis) gastrointestinal (e.g. neuses, peptic ulcer or Crohn's disease), lipid metabolism (e.g. Pabry's disease, diabetes mellitus or bronchitis) diamena, asthma, gout, pancreatitis or Crohn's disease), neurological (e.g. stroke, Alzheimer's disease, multiple sclerosis, eruclogical (e.g. stroke, disease, multiple sclerosis, disease), developmental (e.g. cancers including leukemia, lymphoma cell proliferative disorders (e.g. cancers including leukemia, lymphoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel human Peptidoglycan Recognition Proteins (PGRP): PGRP-Long (PGRP-L), PGRP-intermediate alpha and PGRP-intermediate beta (PGRP-Ialpha and PGRP-Ibeta, ACC70429-ACC70431 and ABRS7566-ABRS7568). The PGRPe and their coding sequences are useful for modulating innate immune system, and as research tools to identify other proteins that are intimately involved in the regulation of antimicrobial processes. The gene for PGRP-L is located on chromosome 19 and the genes for PGRP-Ialpha and PGRP-Ibeta are located on chromosome 19

ó,
                                                                                                 proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 RGWHWVGAHTLGHNSRGFGVAIVGNYTAALPTEAALRTVRDTLPSCAVRAGLLRPDYALL 60

Isolated nucleic acids encoding human and murine peptidoglycan recognition protein-related liver (PGRP-L) proteins, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, and hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human and murine peptidoglycan recognition protein-related liver proteins (PGRP-L) and nucleic acid molecules encoding them. The polypeptides of the invention can be used as food additive or preservative to increase or decrease storage capabilities. The PGRP-L polynucleotides are used for chromosome identification. They are also useful as probes for diagnosing disorders related to the female reproductive system, particularly breast and ovary cancer. They are also useful in the gene therapy of breast and ovarian cancer. The PGRP-L

WPI; 2001-616774/71. N-PSDB; AAS59511. Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.

Example 1; SEQ ID NO 1512; 1069pp; English.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory

encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polymucleotide of the invention; antibodies against polypeptides of the invention; invention; fusion proteins comprising a polypeptide of the invention; a method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides,

0; New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. presence or absence of P. arms in patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at they use out they wipo.int/pub/published_pct_sequences The invention relates to an isolated polynucleotide (ACF64435-ACF64733) ã Gaps Maisonneuve JL; Jones R, Carter lesions associated with acne vulgaris. polynucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit car detecting or determining the presence or absence of P. acnes in a patient, and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. The polynucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymucleotides of the reading frame) contained within the P. acnes polymucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pot_sequences

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess WPI; 2001-639362/73. N-PSDB; AAS81354

Claim 20; SEQ ID NO 47526; 103pp; English.

biodiversity.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal ##X##X#X#X#X#######X

```
cactivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. The invention is useful in developmental biology and in chucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL3611), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this pattent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Drosophila; developmental biology; cell signalling; insecticide;

The present invention describes genes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample. The nucleotide sequences can be used for detecting Enterococcus ancietic acids. Products from the present invention can also be used for screening compounds to identify agonists and antagonists of E. faecalis protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated Enterococcus faecalis polynucleotides - used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus infection.
                                                                                                                 Enterococcus faecalis; infection; vaccine; immune response; diagnosis; detection; attenuation; antigenic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

animal to a member of the genus Entercoccus; preventing or attenuating an inimal to a member of the genus Entercoccus; preventing or attenuating an inimal tection caused by a member of the genus Entercoccus; na an animal comprising administering to the animal the polypeptide and detecting Entercoccus nucleic acids in a biological sample. The E. faccalis nucleic acid molecules and polypeptides are useful as vaccines for preventing or attenuating an entercoccal infection in an animal (e.g. endocarditis, bacteraemia, urinary tract infection (TII), intraabdominal infection, soft tissue infection and neonatal sepsis). The polypeptides are also useful for detecting Entercoccus aureus in immunoassays, as epitope tags, as molecular weight markers, or for generating antibodies that specifically bind E. faccalis polypeptides. The nucleic acid molecules are also useful as probes for gene mapping, or for identifying E. faccalis in biological samples. The kit and methods are useful for detecting Entercoccus antibodies or mucleic acid molecules in a biological sample. The present sequence is a novel E. faccalis only for form part of the printed specification, but was obtained in electronic format directly from the USPPO at sequence data for this patent did sequence.                                                                                                                                                                                                                                                                                         The invention relates to a new isolated nucleic acid molecule comprising a polynucleotide isolated from Enterococcus faecalis appearing as ACA897949-ACA88196 (or sequences complementary to them or 95% identical to them). Also included are the proteins encoded by the above nucleic acids, making a recombinant vector (comprising inserting the isolated nucleic acid molecule cited above into a vector), a host cell comprising the vector (used to produce the protein), an isolated antibody specific for the polypeptides, a hybridoma that produces the antibody, an isolated polypeptide antigen comprising an amino acid sequence of an Enterococcus faecalis polypeptides (and a pharmaceutical diluent, carrier or excipient) where the polypeptide elicits protective antibodies in an excipient.
                                                                                                                                      nucleic acid molecules and polypeptides from Enterococcus faecalis,
                                                                                                                                                         useful as vaccines for preventing or attenuating an enterococcal infection in an animal, or for identifying Enterococcus faecalis in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 526;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         BF040; immunostimulant; antibacterial; gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              . 0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New genes and polypeptides from Enterococcus faecalis, useful as vaccines for preventing, treating or attenuating an infection caused by a member of the Enterococcus genus in an animal, particularly E. faecalis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of a number of polypeptides from Enterococcus faecalis. The proteins can be used as vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal, particularly E. faecalis. The polynucleotide is also useful for preventing or treating E. faecalis infection. The present sequence is a protein of the invention

                                                                                                                                                                                                                                                                            The invention relates to polymucleotide fragments of a gene from Enterococcus faecalis, EF040, and the polypeptides encoded by them. The polypeptides are useful in detecting E. faecalis, as epitope tags, as molecular weight markers on SDS-PAGE gels or for molecular sieve gel filtration columns, in generating antibodies that specifically bind to the E. faecalis polypeptides, in generating an immune response against E. bacterial genera. The polymucleotides are useful as probes for other mapping and for identifying E. faecalis in biological samples. Sequences ABU13508-ABU13755 represent EF040 polypeptides of the invention. Note: sequence data for this patent can also be obtained from USPFO at sequence.
                                                                                                                                                                                                 New BF040 polypeptides and polynucleotides from Enterococcus faecalis, useful for generating an immune response against E. faecalis and other Enterococcus species, and as vaccines against other bacterial genera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Enterococcus faecalis; infection; vaccine; immune response; diagnosis;

                                                                                                                                                              The present sequence represents a protein isolated from Enterococcus faccalis. The present invention describes genes, proteins and antigenic polypeptides isolated from E. faccalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting flaterococcus antibodies in a sample. The nuclectide sequences can be used for detecting Enterococcus nucleic acids. Products from the present invention can also be used for screening compounds to identify agonists and antagonists of E. faecalis protein activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New genes and polypeptides from Enterococcus faecalis, useful as vaccines for preventing, treating or attenuating an infection caused by a member of the Enterococcus genus in an animal, particularly E. faecalis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of a number of polypeptides from Enterococcus faecalis. The proteins can be used as vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal, particularly E. faecalis. The polynucleotide is also useful for preventing or treating E. faecalis infection. The present sequence is a protein of the invention
                                                              New isolated Enterococcus faecalis polynucleotides - used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enterococcus; vaccine; gastrcintestinal disease; diagnosis; antibiotic.

that specifically bind E. faecalis polypeptides. The mucleic acid molecules are also useful as probes for gene mapping, or for identifying E. faecalis in biological samples. The kit and methods are useful for detecting Entercoccus antibodies or mucleic acid molecules in a biological sample. The present sequence is a novel E. faecalis polypeptide of the invention. Note: The sequence data for this patent diot form part of the printed specification, but was obtained in sequence clectronic format directly from the USPFO at sequence.html?DocID=20030017495

The invention relates to polynucleotide fragments of a gene from Enterococcus faecalis, EF040, and the polypeptides encoded by them. The polypeptides are useful in detecting E. faecalis, as epitope tags, as molecular weight markers on SDS-PAGE gels or for molecular sieve gel filtration columns, in generating antibodies that specifically bind to faecalis and other Enterococcus species and as vaccines against E. bacterial genera. The polymucleotides are useful as probes for gene mapping and for identifying E. faecalis in biological samples. Sequences ABU13508-ABU1355 represent EF040 polypeptides of the invention. Note: sequence data for this patent can also be obtained from USPFO at sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New EF040 polypeptides and polynucleotides from Enterococcus faecalis, useful for generating an immune response against E. faecalis and other Enterococcus species, and as vaccines against other bacterial genera.
                                                                                                                                                     EF040; immunostimulant; antibacterial; gene mapping.

RESULT 22
```

The invention relates to a new isolated nucleic acid molecule comprising a polynucleotide isolated from Enterococcus faecalis appearing as ACA87949-ACA88196 (or sequences complementary to them or 5% identical to them). Also included are the proteins encoded by the above nucleic acids, acid molecule cited above into a vector), a host call comprising the code comprising the isolated nucleic acid molecule cited above into a vector), a host call comprising the vector (used to produce the protein), an isolated antibody specific for the polypeptide antigen comprising an amino acid sequence of an Enterococcus faecalis epitope listed in the specification, a vaccine comprising one or more E. feecalis polypeptides (and a pharmaceutical diluent, carrier or comprising an amino acid sequence of an Enterococcus or an infection caused by a member of the genus Enterococcus in an animal to a member of the genus Enterococcus in an animal comprising and infection caused by a member of the genus Enterococcus in an animal comprising and polypeptides are useful as vaccines for preventing or attenuating an enterococcal infection in an animal (e.g. cudocarditis, bacteraemia, urinary tract infection in an animal (e.g. cudocarditis, bacteraemia, urinary tract infection in an animal (c.g. endocarditis, bacteraemia, urinary tract infection in an animal infection, soft tissue infection and neonatal sepsis). The polypeptides are also useful for detecting Enterococcus aureus in immunoassays, as epitope tags, as molecular weight markers, or for generating antibodies

The present sequence represents mouse Bse2. The present invention specifically describes mammalian Esel and 2 proteins (I) and their splice specifically describes mammalian Esel and 2 proteins (I) and their splice are involved in regulation of clathrin-mediated endocytosis (as a complex of enerally (I) cor its (ant)agonists, mimetics, fragments and inactive (T) specific antibodies (Ab) sequences antisense to the (I) optunclectide; agents that downregulate expression of Ese genes or antagonists of an Ese binding partner are used to treat diseases contagonists of an Ese binding partner are used to treat diseases as entagonists of an Ese binding partner are used to block clathringuistion. Particularly overexpression of Esel is used to block clathrin-contagonists of promote endocytosis and resulting changes in callular function. Particularly overexpression of Esel is used to block clathrin-companied endocytosis in vivo or in cell cultures, while administration of (I) is used to promote endocytosis of selected cells. (Ant) agonists of the estimulated to proliferate by a growth factor receptor, and similar concompounds (also inactive Ese mutants) can be used to prevent viral infection. Endocytosis may also be regulated, in vivo or in cell cultures, by forming an Ese-Espis complex, then binding dynamin to the compounds. Generally conditions that can be treated include cancer, remarked complexed contagonials. New nucleic acid encoding Esel and 2 proteins, involved in regulation of endocytosis, used e.g. for treating cancer or preventing viral infection. signalling, tissue development or synaptic transmission Claim 33; Page 48; 99pp; English.

The present invention specifically describes mammalian Bsel and 2

The proteins (I) and their splice variants (Bse = EH-domain and SH3-domain

C regulator of endocytosis). (I) are involved in regulation of clathrin-
mediated endocytosis (as a complex with Esp15 protein), vesicular

c trafficking and actin cytoskeleton. Generally (I) (or its (ant)agonists,

c trafficking and actin cytoskeleton. Generally (I) (or its (ant)agonists,

c trafficking and actin cytoskeleton. Generally (I) (or its (ant)agonists,

c sequences antisense to the (I) polyucoleotide, agents that downregulate

c expression of Bse genes or antagonists of an Ese binding partner are used

c to treat diseases associated with undesirable endocytosis and resulting

changes in cellular function. Particularly overexpression of Esel is used

c to block clathrin-mediated endocytosis in vivo or in cell cultures, while

administration of (I) is used to promite endocytosis of selected cells.

(Art) agonists of (I) or Ab are used to suppress abnormal proliferation of

c calls that can be stimulated to proliferate by a growth factor receptor;

cand similar compounds (also inactive Ese mutants) can be used to prevent

c viral infection. Endocytosis may also be regulated, in vivo or in cell

c cultures, by forming an Ese-Esp15 complex, then binding dynamin to the

complex. Generally conditions that can be treated include cancer;

c abnormal cell division or migration; viral infection, or abnormal

c present sequence represents mouse Esell protein sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding Esel and 2 proteins, involved in regulation of endocytosis, used e.g. for treating cancer or preventing viral infection.
                                                                                                                                                                 Mouse; murine; Esel; Ese2; endocytosis; vesicular trafficking; regulation; actin cytoskeleton; detection; cancer; infection; EH-domain and SH3-domain regulator of endocytosis; anticancer; antiproliferative; antiviral.

The present sequence is a phosphodiesterase (PDE) interacting protein, M14 from rat. The precision modulates the functions and properties of PDEs, specifically cAMP-PDEs, and also targets them to specific subcellular compartments. The present sequence can be used in the diagnosis and treatment of disease conditions associated with PDE activity. The diseases include asthma, oystic fibrosis, inflammatory airway disease, chronic bronchitis, especification granuloma, psoriasis, proliferative skin diseases, endotoxic shock, septic shock, ulcerative collitis, Crohn's disease, reperfusion injury, inflammatory arthritis, atopic dermatitis, ultricaria, adult respiratory distress syndrome, diabetes insipidus, allergic rhinitis, allergic conjunctivitis, vernal conjunctivitis, arterial restenosis, atherosclerosis, inflammatory diseases associated with irritation and pain, theumatoid arthritis, and spon control arthritis, and spon control arthritis, and spon control arthritis, and pain, theumaton arthritis, and spon control arthritis, and spon control arthritis, and pain, theumaton arthritis, and spon control arthritis, and spon control arthritis, and pain, theumaton arthritis, and spon control arthritis, and control arthriti

The sequences given in AAR93272-342 represent peptides which are SH3 ligands/SH3 binding agents. They represent a biased phage library which comprises six random anino acids flanking the tetrapeptide - PPIP which was identified as a recognition sequence for the src SH3 domain. These sequences were identified using the method of the invention. The method comprises contacting the SH3 domain with a mixture of peptides under conditions permitting a ligand to bind to an SH3 domain to form a complex. Any unbound peptides are removed and the complexed peptides are riched by re-contacting them with the SH3 domain and then candidates which bind to the SH3 domain are detected. The isolated SH3 binding peptides may be used in the diagnosis, prevention and treatment of conditions or diseases resulting from cellular processes mediated by an SH3-based interaction. Such diseases include Paget's disease. Other conditions treatable with these peptides include restenosis, rheumatoid arthritis, gout and other problems in which an SH3 of neutrophil oxidase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identification of peptide(s) binding specifically to SH3 domains - for use in inhibiting interactions mediated by SH3 domains in treatment of

SH3-based interaction. Such diseases include Paget's disease. Other conditions treatable with these peptides include restenosis, rheumatoid arthritis, gout and other problems in which an SH3 of neutrophil oxidase p47 and p67 complex is implicated, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequences given in AAR93381-443 represent peptides which are SH3 ligands/SH3 binding agents. They represent a biased phage library which comprises five random amino acids flanking the nonapeptide -RPLPPEDPP which was identified as a recognition sequence for the invention. These sequences were identified using the method of the invention. The method comprises contacting the SH3 domain with a mixture of peptides under conditions permitting a ligand to bind to an SH3 domain to form a complex. Any unbound peptides are removed and the complexed peptides are removed are the selected peptides are removed by re-contacting them with the SH3 domain and then candidates which bind to the SH3 domain are detected. The isolated SH3 binding peptides may be used in the diagnosis, prevention and treatment of conditions or diseases resulting from callular processes mediated by an entities of the shades of the second the second of the second 
                                                                                                                                                                                                                                                                                                                                                                                                                                        Identification of peptide(s) binding specifically to SH3 domains - for use in inhibiting interactions mediated by SH3 domains in treatment of e.g. osteoporosis and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Src; SH3; Src homology region 3; binding affinity; oncogenic protein; protein tyrosine kinase; signal transduction; RNA processing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Indels

the method of the present invertion. Stall (Str homology region 3) binding peptides are selected from: (a) peptides which bind the SH3 domain of Cortactin; (b) peptides which bind the middle SH3 domain of NG¢; (c) peptides which bind the SH3 domain of Abl; (d) peptides which bind the SH3 domain of Abl; (d) peptides which bind the SH3 domain of Abl; (d) peptides which bind the SH3 domain of DLC gamma; (f) peptides which bind the SH3 domain of peptides which bind the SH3 domain of Cf¢; (h) peptides which bind the SH3 domain of Gfbc. The purified binding peptides which bind the SH3 domain of Gfbc. The purified binding peptides can be used in the method to identify inhibitors of their binding to their respective SH3 domains, which could be used to modulate the pharmacological activity of proteins or polypeptide containing the SH3 domain. The peptides can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                             to activate Src or Src-related protein tyrosine kinases, to stimulate the fimune response by increasing the production of certain lymphokines, e.g. tumour necrosis factor-alpha and interleukin-1, or to deliver a conjugated molecule to certain cellular compartments containing Src or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                present sequence represents a random peptide recombinant isolated by
         Src homology region 3 binding peptide - used to activate Src tyrosine kinase(s) and to stimulate immune response by increasing production of certain lymphokine(s), e.g. interleukin-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide #6545 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Probe; human; microarray; gene expression; cervical epithelial cell;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ₽
                                                                                                                                                                                                                                                                                                                                                                                            AAW16924-W1694B are random recombinant peptides derived from one of three peptide libraries, T9, T12 and R8C. The peptides are all SH3 domainbinding peptides. SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tyrosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable abels or imaging agents are useful for imaging cells, tissues and organs in which src or Src-related proteins are expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ó
                                                                                                                                                                                                                                                                     of

Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to single exon nucleic acid probes (SENP: see AA131115-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                          Peptide #8038 encoded by probe for measuring placental gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                    °;
             The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ffp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                              Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human brain expressed single exon probe encoded protein SEQ ID NO: 33212.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21355-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                         Protein #6711 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; bone marrow expressed exon; gene expression analysis; probe; microarray; cancer; leukaemia; lymphoma; myeloma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human bone marrow expressed probe encoded protein SEQ ID NO: 34121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, explepsy and cancers. The present sequence is a protein encoded by one of Single exon nucleic acid probes for analyzing gene expression in human Example 4; SEQ ID NO 33212; 650pp + Sequence Listing; English. the probes of the invention Sequence 44 AA; brains

genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver Human

SEQ ID NO 34213; 658pp; English

(I) for The invention relates to a single exon nucleic acid probe (SENP)

single exon

The invention relates to a spatially-addressable set of

liver, comprising one of 13109 defined mucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhoosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at fire wipo.int/pub/published_pot_sequences ·. derived from human lung, measuring gene expression in a sample derived from human lung, measuring the label detectably bound to each probe of the array, identifying exons in a ewkaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the array; identifying exons in a ewkaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the ewkaryote; and (b) detecting specific hybridisation of detectably labeled mucleic acids from eukaryote lung mRNA, to a single exon probe. In the above mentioned microarray; assigning exons to a single exon of in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single scon comprising one with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that tissues and/or cell types using hybridisation, or encoded by the exons should be assigned to a single gene, a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene expression and structured mRNA and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases such as asthma, lung derived mRNA and for the study of lung diseases such as asthma, lung derived mRNA and for the study of lung diseases such as asthma, lung derived mRNA and for the study of lung diseases such as asthma, lung derived mRNA and for the study of lung diseases such as asthma, lung derived mRNA and for identifying exons in a gene, particularly using human contents, lymphanglolelonyome, sarcoidosis, pulmonary has exons in a gene, particularly using human prick disease. The invention. Note: The sequence date for this patent did not form the the printed specification, but was obtaine
nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample

```
The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, or solation and concers e.g. Addison's disease, allestyles, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Orohn's disease, and intiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular diseases e.g. cerebral anoxia and epilepsy; and (f) cinfectious diseases such as wyocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperporliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypethyroidism; cholesterno! seter storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;

preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.

Disclosure; SEQ ID NO 14502; 1037pp; English.

The present invention describes substantially purified human proteins

(referred to as open reading frame, ORFX where X is 1-11491 (see Table 1)

con the specification). ABN15762 to ABN2722 encode the human ORFX

proteins given in ABP00010 to ABP11500. ORFX proteins are useful for

treating or preventing a pathology associated with an ORFX-associated

disorder in humans, and in the manufacture of a medicament for treating a

cyndrome associated with ORFX-associated disorder. ORFX polymucleotide

cyndrome associated with ORFX-associated disorder. ORFX polymucleotide

cyndrome associated with ORFX-associated disorder. ORFX polymucleotide

cyndrome associated with ORFX-associated disorders, cirrhosis of liver,

psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage,

contangulantation, cardiovascular diseases, disbetes mellitus, systemic

clupus erythematosus, hypertension, hypothyroidism, cholesterol ester

cyndromen adisorders such as multiple sclerosis, rheumatoid

arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host

diseases, autoimmune thyroiditis, myasthenia gravis, graft-versus-host

cinseful for treating burns, incisions, ulcers, for treating observation and treatment of lung or liver fibrosis,

bone degeneration disorders, or periodontal disease, and for gut

cyntection or regeneration and treatment of lung or liver fibrosis,

cyntemic cytokine damage. NB The sequence data for this patent did not

form part of the printed specification, but was obtained in electronic

contant directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                         Sequence 18104, Application US/09252991A

Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILER REFRENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR PLILNG DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 18104
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 21245, Application US/09252991A

Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS.
TITLE OF INVENTION: AERGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE PREPERENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 21245

GENERAL INFORMATION:

APPLICANT: Forsyth, R. Allyn

APPLICANT: Forsyth, R. Allyn

APPLICANT: Oblesen, Karit

APPLICANT: Oblesen, Karit

APPLICANT: Zyskind, Judith

TITLE OF INVENTION: GENES ESSENTIAL FOR MICROBIAL PROLIFERATION AND ANTISENSE THERET

FILE REPERENCE: BLITRA, 0.08A

CURRENT APPLICATION NUMBER: US/09/711,164

CURRENT FILING DATE: 2000-11-09

PRIOR PILING DATE: 1999-11-9

NUMBER OF SEQ ID NOS: 469

SOFTWARE: FASTSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                      Sequence 26018, Application US/09252991A

GENERAL INFORMATION

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT PAPLICATION NUMBER: US 60/074,788

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142
